

PDF Coding Tutorial

Open Ansho allows you to import and code PDF documents. Try selecting (this portion of the sentence) and coding it as [instructions]. The usual text selection and keyboard shortcuts all work the same in a PDF.

However, in a PDF there are a few additional tools. You can code non-text regions of a PDF by clicking and dragging outside text to create a region. You can then apply a code to a selected region in the same way you apply codes to text—by double-clicking on a code, or by pressing Spacebar to access the Codebook.

Coding regions are helpful for coding portions of images, such as parts of figures, or parts of hand-drawn pictures. There are two non-text region tools: Rectangle and Freehand. You can select the region type using the two buttons in the bottom of the PDF pane. Try using both to code the shapes in the image below according to both shape and color.
